APPENDIX 'A'

AGREED DEVIATIONS FOR TEKELEC (F)

Para. 9.3.1.5, Quality Factor of ESA/SCC Generic Specification No. 3010 and Table 2 of this specification.

Measurement of the Q factor shall be performed at frequencies comprised between 100 and 400 MHz.

The value of the Q factor shall be determined at 250MHz by using the following formula:

$$Qfo = Qm \times (fm/fo)^{3/2}$$

where Qm is the Q factor read at frequency fm (fm is that frequency where the quarter-wave line, including the capacitance being measured, is resonating) and fo = 250MHz.

The record sheet shall indicate the Q factor at 250MHz, as required by Table 2 of this specification, as well as the frequency fm at which the Q factor was read.

For LAT level 3: The measurements of the Q factor required by Table 2 of this specification must be done before solderability
